

Tank holes - not leaking

APPLICATION DATA SHEET No. 129

When repairing leaking tanks, the best result is obtained by repairing on the pressure side.

Often, when a tank is leaking, the corrosion is not only isolated to the leak, but is also present in the surrounding area. Make sure to repair the entire affected area, to stop further corrosion.

1. Carry out surface preparation acc. to Wencon surface preparation, next page.
2. Mix and apply a suitable amount of Wencon Rapid. Make sure to get a good contact between the Wencon and the substrate. Avoid air entrapment.
3. For extra security, it is advisable to reinforce the application by the means of a steel plate, grit blasted or ground on the mating surface and fixed into the Wencon product before curing. If the surface of the substrate is shaped, give the plate the approximate same shape before bedding it on-to the repair. Make sure, that the plate will get in good contact with the Wencon material.
4. To protect against further bi-metallic corrosion, treat the entire top of the repair surface with Wencon Coating, white and blue.

Alternative products: Wencon Ceramic products

Wencon surface preparation

Choose the relevant surface preparation, depending on the nature of the job.

Surface preparation using dry blasting methods:

Application with Wencon products on a dry surface, at minimum 3°C above dew point.

1. Blast the machine part to SA 2,5 using sharp-edged blasting media, to a roughness of min. 75 microns.
2. Leave the part for sweating out salts in a warm place for at least 12 hours or heat it up to 30 - 40°C (86-104 °F) using gas torches.
3. Blast again to SA 2,5, prior to the application.
4. For parts containing a lot of water and salt, it may be necessary to repeat point 2 and 3, until the surface remains light grey, for at least 2 hours after blasting.
5. For optimal adhesion of Wencon products, always use Wencon Bio Cleaner or Wencon Cleaner prior to application. Follow one of below two methods:
 - 5.1 **Wencon Bio Cleaner**
Wet surface: Apply Wencon Bio Cleaner and let it work for 5-10 min. If necessary use a brush, to make sure the surface is clean. Rinse off with clean water and wipe off with an absorbing cloth.

Dry surface: Apply Wencon Bio Cleaner and let it work for 5-10 min. If necessary use a brush, to make sure the surface is clean. Rinse off with clean water and dry with an absorbing cloth or with compressed air for a completely dry surface. Hereafter any Wencon products can be applied.
 - 5.2 **Wencon Cleaner**
After surface preparation, apply Wencon Cleaner with a brush and allow the product to evaporate before applying other Wencon products. Wencon Cleaner is non-flammable. Use only in large or well ventilated rooms.

Surface preparation using wet/damp methods:

Water jet the entire surface with water and sand to a standard equal, to SA 2,5 as described above.

If the surface is left wet after surface preparation, is it important to dry out the surface or alternatively use a Wencon UW product.

Surface preparation for emergency/temporary applications:

If above surface preparation methods are not possible, it may be necessary to use one of below methods:

- Blasting
- Grinding
- Needle Gunning

In emergency / temporary applications it may be difficult to prepare the surface according to above methods. In any case, it is important to clean the surface to SA 2,5 and 75 microns roughness. If possible dry the surface before applying. If not possible, use Wencon UW products.
